pySerial is a lightweight module for Python that enables you to implement serial port access capabilities into your applications. pySerial accesses the port settings using the properties of Python and provides support for different byte sizes, flow control and parity values. pySerial Requirements: python>=2.6.2 sockets What is the appropriate Python distribution (32-bit vs 64-bit) and version (2.7 or 3.x) to download to make sure I can download and install everything I need to install for the next phase of my project? A: You need the right architecture version of python. You can check it by opening python.org site and look at About page. If you're using 32 bit version of Python, then you need to download: Python 2.7 32 bit binary installer for Windows and Python 3.2 32 bit binary installer for Windows If you're using 64 bit version of Python, then you need to download: Python 3.3 64 bit binary installer for Windows and Python 3.4 64 bit binary installer for Windows Before that, you have to install: Tcl/Tk (Tkinter module for python) tkinter (included in python) Steps to install Python Open your command prompt, and navigate to your python directory. Type: python -m pip install -U setuptools Type: python -m pip install -U wheel Type: python -m pip install -U pyserial If you have already installed python then you can type: python -m pip install -U pyserial Type: python -m pip install -U sockets Type: python -m pip install -U pycrypto Type: python -m pip install -U paramiko If you're using Python 3.x then you have to type: python3 -m pip install -U paramiko I have installed Python 3.x 64 bit version in my machine and everything is working fine. If it doesn't work for you, then you have to install 32 bit version of Python 3.x. Good luck! In a conventional cellular phone system, when a cellular phone is used for sending and receiving information, a service provider, such as a base station, records this information on a message log. Semantics of returning null from an object method What happens if you have a method that returns null? Is there any way to make it work as expected or would one need to add a check? A: I don't think there is a way to actually "make it work" - a method returning a value like this is kind of a misnomer. If you have a method that returns null, it's always going to return null.

pySerial is a lightweight module for Python that enables you to implement serial port access capabilities into your applications. Details pySerial provides a set of classes and functions that can be used to interface with the serial port in Python. Python is a scripting language, with a dynamic type system, that can be used to extend the capabilities of almost any program. In essence, Python is a ready-made extension to the base functionality of C, C++, and Java and is a very popular programming language. It is cross-platform, and works with Windows, Unix, Mac OS, and Linux computers. It is one of the most often used languages for writing computer programs. The pySerial module uses python.h and PySerial to communicate with the port, however its own modules and classes have a more direct Python interface. Source Code pySerial consists of two files: pySerial.c and pySerial.py. The pySerial.py file contains the pySerial main module, and provides the classes used to access the port. The pySerial.c file contains the actual port access code. Classes There are a number of Python objects that make up the pySerial library. Serial pySerial.SerialPort The Serial.py module provides access to the serial port device. A serial port is a hardware device that allows data to be transmitted over a wire, such as an RS-232 port on your computer. serial.Serial pySerial.SerialException The SerialException class is an exception that is thrown when the Python code raises an exception or fails to perform an operation that is expected to succeed. Note: This exception can also be raised by pySerial itself. File pySerial.File The File.py module provides access to the python open, read, write and close files. File.py is a subclass of the python.File object, and uses the built-in python objects to implement the file object functionality. Function pySerial.Function The Function.py module provides a number of functions that have been implemented that provide the functionality to access the port. Function.py contains a number of classes that represent the individual serial ports such as the DSR (Data Set Ready), RTS (Request to Send), and CTS (Clear to Send) functions. The pySerial library also provides the file handling capabilities to read and write data to the serial port. Exception pySerial.Exception pySerial.Exception is a subclass of the Python.Exception object, which raises the exception when it is raised by the port access code. Thread pySerial.Thread The pySerial.Thread.py module provides the actual functionality for the thread objects. Thread provides basic functionality such as the ability to
